

## HOW TO CHANGE THE MAC ADDRESS IN VIRTUALBOX FOR A VIRTUAL MACHINE

### SCOPE

*How to change the MAC address within the VirtualBox software to give the server a different MAC address*

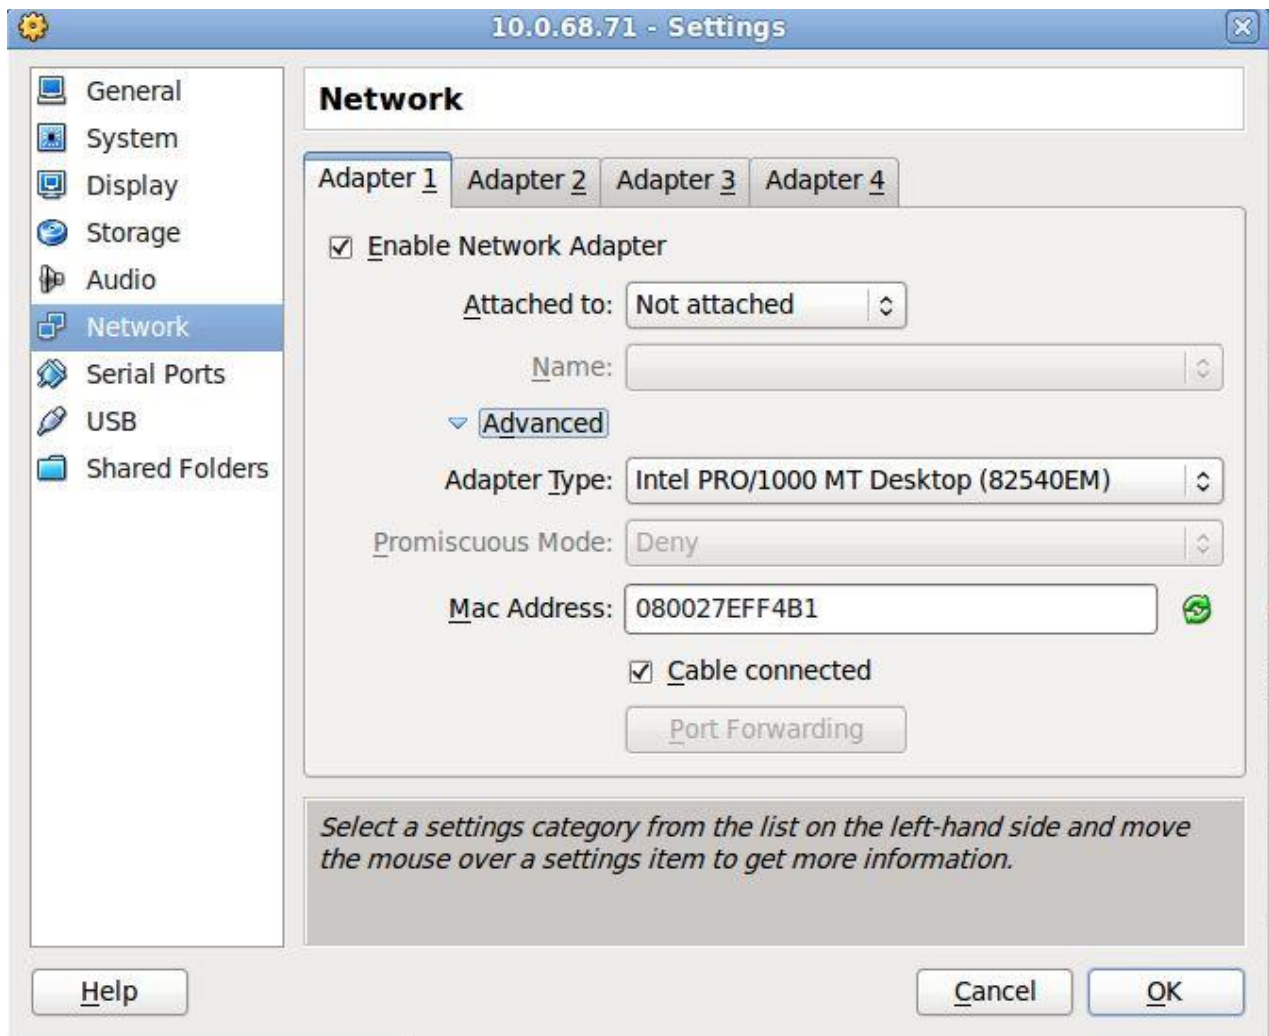

**Example: VirtualBox Interface on a QBR-S device**

### CAUSE

If the machine being protected has any software or hardware dependent on the MAC address, or there are certain domain restrictions and firewall restrictions that may require pairing from the MAC address

## SOLUTION

1. Select the VM from within VirtualBox GUI and click on settings.
2. Select the network tab and then select the correct adapter (Typically adapter 1)

3. When you click the advanced tab, you'll then be able to select the MAC address of the device and that can be reassigned to the MAC of the machine that you are virtualizing.
4. Once networking is enabled and the machine is spun up, the virtual instance should have the MAC address that you have specified.
